MATÍAS FILGUEIRAS

Junior Backend / Full Stack Developer

Montevideo, Uruguay | +598 92 346 566 | mfilgueirass13@gmail.com

linkedin.com/in/matiszn | github.com/mqtissj

PROFESSIONAL SUMMARY

Junior full stack developer with a backend focus and three products running in production: an electric-vehicle trip planner published on Google Play and the App Store, a public-data platform, and a client website in daily business use. I build REST APIs in Python/FastAPI, Java/Spring Boot and C#/.NET over PostgreSQL, MySQL and SQL Server, with 592 automated tests and Docker-based deployment on my main backend. Studying Systems Analyst at ORT Uruguay, final project in progress. Looking for a first junior role in backend or full stack development.

TECHNICAL SKILLS

Languages: Java, C#, Python, TypeScript, JavaScript, SQL, HTML5, CSS3

Backend: Spring Boot, ASP.NET MVC, Entity Framework, FastAPI, Pydantic, REST API design, JWT authentication, OAuth 2.0 (Google and Apple Sign-In), Swagger / OpenAPI

Frontend: React, Next.js 15 (App Router, SSR, SSG), React Native (Expo), Tailwind CSS, Recharts, d3-geo

Databases: PostgreSQL, MySQL, SQL Server, MongoDB, Supabase. Schema design, normalisation, SQL queries

Testing and QA: pytest, Jest, Playwright (end-to-end), Postman, unit and integration testing, endpoint validation, edge-case analysis, debugging

DevOps and Cloud: Docker, GitHub Actions (CI/CD), Git, GitHub, Railway, Vercel, Oracle Cloud, AWS Academy, Microsoft Azure (fundamentals)

Practices: Agile / Scrum, object-oriented programming, layered architecture, code review, AI-assisted development (Claude Code)

PROFESSIONAL EXPERIENCE

Freelance Web Developer, PF Negocios Inmobiliarios

2026 | Real estate agency, Montevideo | Next.js, React, TypeScript, Supabase (PostgreSQL and Storage), SSR, SEO

- Designed and delivered the agency's website end to end. It is live in production and the business uses it every day to publish properties.
- Built a property catalogue with combinable filters (bedrooms, bathrooms, pets) held in the URL, so any search can be shared and is indexed by Google.
- Modelled the content in Supabase so the client publishes listings without touching code, which removed me from day-to-day updates.
- Added server-rendered Open Graph images per property and a pre-filled WhatsApp hand-off, turning shared links into direct enquiries.

PROJECTS IN PRODUCTION

RouteEV, trip planner for electric vehicles in Uruguay

2026 - present | routeev.uy | github.com/routeev | Published on Google Play and the App Store | Python, FastAPI, PostgreSQL, Docker, JWT, React Native (Expo), TypeScript, MapLibre, pytest

- Designed and built the routing engine: Valhalla resolves the street-level path and a custom A* picks the charging stops over a 262-node graph, with the battery held inside the search state. Two measured optimisations took one route from 24 s to 0.9 s.
- Built and documented a REST API covering routing, a 587-model electric-vehicle catalogue and the country's 261 public charging stations (213 UTE plus 48 private), with JWT authentication plus Google and Apple Sign-In.
- Wrote 592 automated tests with pytest over the routing algorithms, authentication flows, pricing and edge cases, and run them on every change.

- Containerised the backend with Docker Compose (API, Valhalla and Caddy) and run it on an Oracle Cloud Always Free virtual machine in São Paulo.
- Shipped the Android and iOS app in React Native and Expo, including background location tracking during an active trip, and took it through release on both stores.
- Set the priorities from a survey of Uruguayan electric-vehicle drivers, and kept an open trip simulator that needs no account.

realidad.uy, public-data platform for Uruguay

2026 - present | realidad.uy | Next.js 15, React 19, TypeScript, Tailwind CSS, d3-geo, Recharts, GitHub Actions

- Built an ingestion pipeline from official sources (National Statistics Institute, Central Bank, Electoral Court, Ministry of the Interior, World Bank): 1,396 observations and 573 election results, each stored with its source URL, period and methodology notes.
- Wrote a validation step that fails the build when a total does not match the official count, and verified all 136 mayors one by one against the proclamation records.
- Automated the monthly ingestion and the continuous integration with GitHub Actions, so new official data reaches the live site without manual work.
- Built accessible, keyboard-navigable SVG choropleth maps of the 19 departments and 136 municipalities, with open CSV downloads and embeddable charts for newsrooms.

ACADEMIC PROJECTS, ORT URUGUAY

Objective Tracker Dashboard

2025 · Java, Spring Boot, React, MySQL. Multi-tier REST API with a React dashboard, in a three-person Scrum team.

Sports and Athletes Management

2025 · C#, ASP.NET MVC, SQL Server. Normalised schema, role-based access control, eight edge-case defects fixed.

Toll Management REST API

2025 · Java, Spring Boot. Layered architecture, correct HTTP semantics and Swagger / OpenAPI docs.

Food Inventory and Users

2024 · JavaScript, HTML5, CSS3. Authentication without frameworks, and real-time geolocation.

Library Book Rental

2024 · Java, data structures. Rental logic over abstract data types with custom algorithms.

EDUCATION

Systems Analyst (Analista Programador), ORT Uruguay

Mar 2026 - present

Final project in progress. Continuing to the BSc in Systems.

Web Programmer (Programador Web), ORT Uruguay

Jan 2023 - May 2026

Certified. Backend development, software architecture, databases and REST APIs.

CERTIFICATIONS AND LANGUAGES

Certifications: GeneXus 18 Junior Analyst (March 2026), Cambridge B2 First Certificate in English

Languages: Spanish (native), English (B2)

ABOUT ME

Persistence: If something does not work the first time, I keep at it until it does. Same with a bug.

Versatility: I move between Java, C#, Python and JavaScript without friction, and I pick up new stacks quickly.

Quality focus: I test the edge cases, not just the happy path, and I write error messages that help whoever reads them.
